

ABSTRACT

An efforts to save the earth with movements that promote sustainable principles have emerged. This is because the state of the environment around us who have not maintained any longer for the issues of “Pemanasan Global” or so-called Global Warming broached. As with any development that became one of the main causes of environmental damage. Green areas in urban city converted into a concrete jungle in the interest of the infrastructure. according to data DSDM building has accounted for the largest CO₂ in the sectors of energy consumption.

Kaskus as a pioneer of "The Largest Indonesian Community" in Indonesia need an office that is designed to prioritizing energy savings in terms of circulation, lighting, and health in his office with the use of interior materials that certified by eco-friendly label. With the Eco-Design approach is applied to the design concept of this an office which refers to the norms and principles of sustainable design where the main purpose to save the earth from environmental damage and bring people closer and love on the surrounding environment.

It is expected the principles of sustainable design is not only applied in the offices of large urban areas, but also should be applied in small offices and areas of suburban in order to create a shared commitment to save the earth from environmental issues that exist today.
