

ABSTRACT

Puskesmas is health organization that is comprehensive, integrated, equitable, acceptable and affordable to people. Puskesmas serve the people using the Register Computerization but in use, they found a weakness, when search name from patient data can not produce accurate information or functionality does not work, if the patient moves, puskesmas' employees still have to input the patient data and when reporting health centers to the health department is still manual.

Therefore, its needs to make a system used to help build a health clinic in the health insights, empowering people and the affirmation that the health center is the first service. The system should be able to provide information to people in real time and facilitate pregnant mothers to carry out checks on any existing health centers in West Java. System can make people be aware of health and health care for pregnant, especially in the presence of the notification melalui Broadcast SMS containing about tips for pregnant.

Keywords: Department of Health, Pregnancy, SMS Broadcast, Medical Record.
