

ABSTRACT

Clarifying the issue is an activity undertaken to help provide complete information on issues of unclear news. However, in Indonesia there is little concern and lack of interest of the people towards clarification activities, so that complete information on news issues whose validity can be proven is still difficult to obtain. The solution provided is to create a web-based application that can help users to clarify the news issues completely. This application is called True Or Hoax Web Application (TOHO). In making this application into two modules, such as Editor module, and contributor module. Meanwhile, in this final project will focus more on the module contributor. Contributors are a designation for users who clarify the issue of news. In this contributor module will provide some features like submit news issues, provide arguments for news issues, give a vote "TRUE" or "HOAX", do like news issues, manage profiles, view news and news issues, comment on news, and get Points according to the activity on the specified application for the contributor.

Keywords: News issue, TOHO, True, Hoax
