ABSTRACT

The university library is a place for reading for the university community and also the general public, in general the library is identical with the word boring and unattractive, which results in a quiet number of library visitors. But this did not occur in the Library at Universitas Pendidikan Indonesia or UPI, the UPI library was always filled with visitors. But with so many visitors, the UPI library has various problems related to its facilities and infrastructure, especially in the aspect of interior arrangement. One of the problems is the lack of information on certain space functions for visitors, such as the closed function of public space, the less organized library flow and the lack of information on the collection shelves so users are confused when looking for certain space or collection. Therefore the application of signage at interior of Universitas Pendidikan Indonesia Library is very important to solve the existing problems.
