ABSTRACT

A good data management and information delivery system is needed in the process of registering and accepting new students so there is no misunderstanding of information by prospective applicants. In the period of registration and acceptance of new students, the school is required to be able to process data registrants and provide valid information quickly and clearly. Therefore, the application for New Student Registration and Admission (PPDB) is required. This application will be built using PHP programming, with CodeIgniter framework and the database using MySQL. The application development method uses the Prototype methodology. This application is only used in the Bendo 1 SDN service.

Keywords: *Registration; School; PHP; CodeIgniter; MySQL; Prototype*
