

## ABSTRACT

---

*Telkom University is one of the private universities in Indonesia. which has quite complete facilities and infrastructure. One of these facilities is the canteen of applied science faculty, this canteen is filled with various stalls offering food and drinks, so that many customers visit each day from students to lecturers. But this canteen has several problems in service and management. These problems include ordering food still using a paper-based system, recording transactions of traders who only use the sales receipt plus the payment system using the manual method which causes the calculation to be quite time consuming. Then it is necessary to build a system that can help improve the quality of canteen services. Web-based food and beverage payment and ordering applications are made. Applications are built using PHP programs with MYSQL databases. This application has a digital food and beverage ordering feature, recording computed transactions*
