ABSTRACT

In the process of recording violations in Al-Qudwah Integrated High School, the application was used, but the application used was an application belonging to the students. The features available in the application are not yet available in full for the Counseling Guidance section. At the time the Counseling Guidance teacher had entered data on violations the Counseling Guidance teacher was obliged to notify the students 'parents, however there were some Counseling Guidance teachers not directly notifying the students' parents. Counseling Guidance Teacher will make a report of violations when there are students who commit violations, at certain times when the principal requests a violation report, the Guidance Counseling teacher takes a long time to make a report of violations so that they cannot be asked for a sudden report. Therefore it is necessary to have a Web-Based Abuse Registration Application at the Al-Qudwah Integrated High School which will be used for recording violation data, notifying parents, creating violation report files, creating warning letters. It also records, records and stores in one master database. This application is built with Prototype software development model, Unified Model Language (UML) to model the system, and uses the PHP Programming Language with Codeigniter Framework as well as MySQL databases and other software.

Key words: Violation Recording, Website, Prototype, Codeigniter
