ABSTRACT

eKopz is a digital cooperative platform that offers an easier, safer and more accessible way of cooperating anywhere. With the proposed minimum viable product in the form of bookkeeping automation and cooperative financial transparency, e-commerce specifically for cooperatives that is integrated directly with cooperative bookkeeping, and information portals on cooperatives and finance, eKopz is expected to be a solution for cooperatives as well as their members in organizing. The eKopz working methodology will contain a series of process activities such as analyzing the needs of target users, designing the system, then continuing the system testing by the developer, and implementing the system that is ready to operate. Based on the results of research and testing, each application functionality runs in accordance with the specifications of user requirements.
