

LIST OF TABLES

1.1	Input Example from 3 different languages	2
1.2	Arabic side of MSDs	3
1.3	Dictionary dependency problem example that the two type of word must be known before both of it	3
2.1	Every Arabic word both <i>fi'il</i> and <i>isim</i> attach to one of these 14 pronouns .	10
2.2	Verb forms	11
2.3	Buckwalter Examples	12
3.1	Raw data from corpus.quran.com, location means the address of each every word in the Qur'an, form is its Arabic word on Buckwalter form, TAG is POS TAG of its word, and features is its MSD (verb form, root, lemma, gen, num etc.	17
3.2	The format of the pattern from each Arabic word. In the form of a prefix, suffix, and diacritics infix pattern beside the prefix and suffix, which is the differentiator of each type of word, <i>dhomir</i> , and <i>wazan</i>	19
3.3	Examples of prefixes and suffixes exist. The number of prefixes and suffixes available for all types of words is more than this. It is just an example of a prefix and suffix that is in the form I form	19
3.4	The example of sub word vectorizing	20
3.5	RNN layer detail	21
4.1	The result of preprocessing process from Quran corpus data, Position is verse, chapter and word position in the Qur'an, word, and root is in the Buckwalter form. Tag, <i>Wazan</i> and other features in the part of making msd gold later on.	27
4.2	This table results from generating processes from Quran corpus data with the help of a pattern table. The type of word and <i>dhamir</i> or pronoun is getting from the pattern table to help the following process in the system. MSD already in the proper format after this process	28
4.3	The result of pattern extraction and subword vectorizing process	29
4.4	The number of data after splitting the dataset	29
4.5	Testing result	29
4.6	The details of result accuracy base on the MSD	30
4.7	MSD tag that produce by Jabalin system and translate into this system, the position starts from left to right	32
4.8	Result Jabalin system per all of the MSD	33
4.9	Comparing the result	34

4.10	The result with different kind of neural based method	35
4.11	The result with different vectorizing approach	35
4.12	The result with different type of optimizer	36
A.1	Mapping the Arabic features into the MSD	43
A.2	All MSD Tags and values	45
A.3	Data statistics	46
