ABSTRAK

Abstract : *The progress of science in the current era is a science that must be applied to the general public. With astronomy activist researchers, especially those in the field of space and also Indonesian astronomy students, they have produced new innovations in providing a place for multidisciplinary science center activities. Science center is a center for learning science scientifically, but it refers more to a sub-space science center which is distinguished by its type. Certainly in the design of the space science center each has its own values and goals that make the space science center different from one another, the values in this space science center refer to the representation of the trid- harma of higher education in the form of education (educational and interactive content), research (research). science) and community service (tourism). Each of the 3 trid- harma points is important in this design. The space science center is also not only a building with complete facilities, but also develops together by bringing up every individual to be active and productive. The use of the human behavior approach is considered suitable by seeing the response of how users move in it.*

Keywords: *Human Behavior, Space Science Center, Values*
