

ABSTRACT

Disaster Management Volunteers, hereinafter referred to as volunteers, are a person or group of people who have the ability and concern to work voluntarily and sincerely in disaster management efforts. The difficulty of volunteers is in making campaigns, it is difficult to manage donation funds, such as difficulty determining what items must be purchased and needed to be distributed to victims of natural disasters and making reports on receipt of goods that have been received by victims or recipients of donations. Seeing this idea, the idea of building a system based on this emerged that could help people who had little or no trust when going to make online donations and the proceeds of receiving donations were not covered or manipulated for personal gain. The methodology used in the creation of this application is the Waterfall method. The programming languages used are Php CodeIgniter and Html. Database used is MySQL and the editor used is XAMPP. From the system design process generated system see Campaign Data, see Campaign Submission History, Campaign Submission.
