

ABSTRACT

Stock is one of the instruments in the capital market that is in great demand by investors. By investing in stocks, it allows investors to get high income. However, stock price fluctuations are very high and cause many investors to suffer losses.

In this study, predictions of stock price movements were carried out using technical indicators. This technical indicator is used to determine various factors in the movement of stock prices so that the direction of the stock movement is like the market trend and the strength of the trend.

The test results will be calculated in percent for profit. From the calculation of one combination, two combinations, three combinations, and four combinations of each indicator, the result is that the largest profit percentage rate with two indicators lies in in the combination of DC and RSI resulting in 6,4% profit percentage, then the largest profit percentage rate with three indicators is obtained with the combination of MACD, DC, and RSI resulting in 7.4% profit percentage and last of all, the largest profit percentage rate with four indicators is obtained with the combination of CMF, MACD, DC, and RSI resulting in 2.65% profit percentage
