

ABSTRACT

The hospital is a center for health facilities in the community which is important, needed by the community, but the current condition is that there are still many unfavorable paradigms for hospitals, such as hospitals being scary, depressing places, only places for sick people, etc. The government's role in the workers' view of the hospital is to make efforts to rebrand the hospital into a healthy home, aiming to create a new face for the hospital to become a place that gives a more optimistic feel and a positive atmosphere. The same is true for the view that Asri Purwakarta General Hospital wants to create, as a type c hospital in Purwakarta City that wants to continue to develop to be able to better meet the needs of the community. The interior condition of the Asri Purwakarta Hospital itself still has a number of problems in it, starting from problems with space organization, psychological comfort, physical comfort, furniture, to signage or directions. The purpose of this interior redesign is to realize the role of interior design in shaping a hospital environment that can help the recovery process by applying a healing environment approach, thus creating a hospital design that can meet the needs of activities in the hospital, a comfortable, calm, not scary room atmosphere. as well as giving an optimistic feel with the application of natural elements in it. The interior redesign of the hospital is based on research using qualitative methods taken from literature studies, field surveys, interviews, and current phenomena. The benefits of this design are expected to open the view that the role of interior design is to create hospital designs that meet needs, assist the healing process in hospitals, attract consumers, and help improve the quality of health facilities.
