

ABSTRACT

RSUD Sekarwangi in Sukabumi Regency, West Java, is an important hospital with class B status. The hospital has undergone infrastructure development to improve health services. However, the 2023 survey results show that some rooms, especially polyclinics, require redesign due to the issue of inadequate waiting space, especially during the pandemic. The design approach of space psychology at Sekarwangi Hospital aims to create a soothing environment that supports patient recovery. The integration of wellness and healing environment elements in the design is expected to improve patient well-being and the efficiency of medical personnel. The theme "Healing Spaces, Thriving Patients: Integrating Wellness and Healing Environments in Clinical Concepts" emphasizes positive patient experiences and environments that support recovery.
