

ABSTRACT

Coworking space is an open space (public area) used by workers in a collaborative/modern style. Over time, the trend of transforming ways of working, technology and culture in an area increases the human need for a workplace or workspace with the growth of startup businesses. With the increasing growth of this business, facilities are needed that can meet their needs, one of which is a coworking space. The purpose of designing this Coworking Space is to create facilities that suit user needs and coworking standards or requirements to increase comfort and productivity to support social activities and interact between users. To know this, the methods used in this design include interviews, observations, field studies, documentation, and literature studies. Based on the results of existing data processing, the availability of coworking facilities has not fully been able to support the needs of its users, especially in terms of the value of interaction and collaboration. For this reason, a redesign needs to be carried out which can pay attention to the needs of its users to support the activities in the coworking space.

Keywords: coworking space, workspace, interaction, collaboration
