

ABSTRACT

One of the problems with a large campus that has many departments is the difficulty in finding information or news for students. Each department and sub-domain usually provide information separately, so the information is not well integrated. Students often must follow various university social media accounts to get updates related to campus activities. However, because these social applications are rarely opened by students, they often miss the latest news from Telkom University. Based on this background, an integrated news application for Telkom University was created to facilitate access and search for news for the Telkom University community. This application is made to show the latest news of Telkom University, news of each study program, news of Telkom University facilities, and other news. Users can mark posts to be viewed later. Based on the survey results, all sixteen respondents need a centralized news application. So, Tel-U News is suitable to be a centralized news application about Telkom University.

Keywords: Tel-U News, Telkom University, application, news, centralized
