The development of the fashion industry continues to experience rapid increases, this causes the accumulation of fashion production waste to increasingly pile up. Accumulation of fashion waste occurred at one of the Ciganitri regional confectionery partners, one of the most waste produced was patterned cotton fabric. The increasing industrial development is also caused by the many fashion trends, one of which is the fashion trend that uses crochet techniques. With the accumulation of waste and the crochet trend, there are many opportunities to use waste into yarn as a new alternative. This research aims to create fashion products from patterned cotton fabric using crochet techniques. This research method uses qualitative methods using literature study data collection techniques, observation, interviews and exploration. The results of this research will be applied to fashion products with a nautical style concept using crocheted cotton waste material. From the results of the experiments that the author has carried out, there are still many opportunities to create other fashion products that have not been realized and can still be developed.
