

PREFACE

Before you read the master thesis “Social Media Data Generalization Using an Ontological Approach to Support Digital Forensic Activities” It has been written to fulfill the graduation requirements of the Cybersecurity and Digital Forensics program at Telkom University in Bandung.

In the past, getting good grades was the only end goal and less challenging. Until I eventually entered graduate school in this field, writing a thesis was very exhausting, but it became a new challenge to be tackled. The work was so difficult, yet I wanted to complete this thesis. “I will work on it even while crying,” is what I often said.

Fortunately, I was accompanied by my very patient and supportive supervisor, who not only guided the thesis research process but also helped build my mindset. In addition, lecturers and other experts in digital forensics also helped to provide suggestions and develop this thesis. I would like to express my heartfelt thanks to my friends for their mental support. Finally, my special gratitude to my loving family, for their endless love and prayers for me. Your support has meant the world to me and has helped me grow both as a learner and as a person.

Bandung,

Sara Lutami Pardede
