

ABSTRACT

Company value is an indicator of a company's success in managing resources and reflects investors' perceptions of the company's future prospects. This value is an important reference for the public and investors in making investment decisions. This study aims to evaluate the influence of capital structure, profitability, and liquidity on company value in the mining sector listed on the Indonesia Stock Exchange from 2019 to 2023.

The approach used is quantitative with a purposive sampling method, resulting in 47 companies as samples over five years, yielding a total of 235 observations. The analytical methods employed include descriptive statistical analysis and panel data regression. The research results indicate that, simultaneously, capital structure, profitability, and liquidity significantly influence firm value. Partially, only profitability shows a significant positive influence on firm value, while capital structure and liquidity do not have a significant influence.

For future research, it is recommended to add or modify variables and the research period to obtain more comprehensive results, thereby ensuring the findings are more consistent with the hypotheses established.
