

ABSTRACT

Cardiovascular disease or one of the diseases known as coronary heart disease is still the number one cause of death worldwide. In Indonesia, the death rate from cardiovascular disease reaches 651,481 people every year, consisting of 331,349 deaths due to stroke, 245,343 deaths due to coronary heart disease, 50,620 deaths due to hypertensive heart disease. The purpose of this design is as an educational media in the form of a good information website and can invite audiences to maintain heart health by knowing the many nutrients contained in avocados and getting to know more about coronary heart disease and avocado management itself. This design uses qualitative research methods that are descriptive and tend to use analysis, collecting data from observations, interviews, literature review, then questionnaire. This design uses SWOT analysis and matrix analysis for data management. The results of the design of this information website are expected to reduce cases of coronary heart disease in Indonesia, especially in Bandung City and Bandung District , besides that the audience can know that one of the efforts that can prevent coronary heart disease is by consuming avocados, this contributes directly to sustainable development goals, especially SDG's 3, Healthy and Prosperous Life.
