

ABSTRACT

This web-based clothing inventory and sales management application was developed to manage inventory, sales transactions, and report generation at Mada Mikha micro, small, and medium enterprises that sell products in the form of clothing. This system aims to minimize recording errors and help business management. Application development is carried out using the Waterfall method, which includes requirements analysis, design, implementation, and testing. The tools used include Laravel as a framework, MySQL as a database, and Bootstrap for interface display. The purpose of making this web-based application is to manage raw material inventory and sales, manage sales transactions, and display general journals and ledgers, display inventory reports and sales reports that can be printed PDF. Thus, this system is expected to help business people in managing their business.

Keywords: inventory, sales
