

Abstract

A big family which has many heredities needs a way to exchange information among each family in easy way, practical, and efficient, not only in term of exchanging information but also in term of knowing each other family member. The fact which comes up now is that the generation who live in an age which is different with the age of earlier generation does not know the family genealogy clearly from the family root that is Imam Zahid until nowadays generation.

Needed a method where problem like this can be handled properly so that the other generations of the family became closer to each other that is a website application that can accommodate the whole family things like news or events exchange specific event among families and the history information of the history, heredity structure of Imam Zahid, and can display a family tree which shows the entire registered family in database of this application

"Family and Kinship Website IBIZ (Association of Children of Imam Zahid)" is built using the programming language of HTML 5, CSS 3, PHP and Javascript, using Dreamweaver interface design as well as the MySQL database.

Key words: history, family structure, family tree.
